

Bethnal Student Living

Bethnal Student Living (BSL) provides affordable student accommodation in the heart of East London. For their students, wireless Internet connectivity is essential. Not only do they need it to study, but they rely on it to communicate with family and friends while away from home.

Project Focus

Wireless Network and Internet Connectivity

Requirement

With 250 residents spread over 5 floors, BSL needed a wireless system that could cope with a large volume of traffic, constantly changing users and a good Wi-Fi signal from all rooms.

BSL wanted to ensure their new Wi-Fi network would not only be fast, but also safe from malicious online attacks and protect residents from harmful content. At the same time BSL wanted a solution that would be easy to manage and with the ability to control the bandwidth used by each tenant to ensure a truly fair environment for all Internet users.

Solution

Advanced, reliable Wi-Fi... and superfast Internet.

After a free two week trial, BTA designed and installed a permanent wireless solution which met all of BSL's requirements and exceeded expectations. It was delivered on time, within budget using Cisco Meraki Wireless Access Points and Dell SonicWALL firewalls, providing high quality wireless access, fast and fair downloading, easy online management, and safe and secure surfing.

The project was so successful that BTA was enlisted to provide BSL with a superfast Internet service. BTA selected their partner Easynet and managed the installation and changeover to the new service and now provides ongoing network support to the business.
